

HÖRMANN

A MATH ADVENTURE

Kids won't do worksheets.
They'll fight a boss for two hours.

PLAYABLE TODAY · AGES 5-7 · ANY BROWSER

THE PREMISE

We already know how to
make a child **unable to stop.**

42

attorneys general are suing Meta
for **deliberately designing
addiction** into products used by
children.¹

It works. Nobody ever aimed it at anything good.

THE COST

Iceland just posted its worst maths result ever.

34% of Icelandic 15-year-olds lack basic maths proficiency.³

Attention got better at holding them.
School did not.

THE IDEA

Same craft. Better target.

WHAT THE ATTENTION INDUSTRY PERFECTED

- ▶ Feedback in under a second
- ▶ Always *just barely* winning
- ▶ Reward that varies
- ▶ A reason to come back tomorrow
- ▶ Never let them feel stupid

WHAT A CHILD LEARNING MATHS NEEDS

- ▶ Feedback in under a second
- ▶ Always *just barely* winning
- ▶ Reward that varies
- ▶ A reason to come back tomorrow
- ▶ Never let them feel stupid

The same list. Nobody aimed it at times tables.

WHY ME

My son quits the second he smells failure.

ADHD, ODD, a high IQ. He will fight a hard boss for two hours. He will not do ten minutes of worksheets.

I make games. So I stopped shopping and started building.

Immediate, or nothing

Children with ADHD need reinforcement that is **immediate, frequent and certain**. Delayed reward never bridges the gap.⁵

THE GAME

Every owl is locked. Maths is the key.

You are a crow

Run, jump, peck, collect. A real platformer.

Owls wear padlocks

Chained, in your way, and needing you.

You free them

Nobody is graded. Something is rescued.

Take the maths out and the game stops working.

Chess ratings, for a **six-year-old's arithmetic.**

Every answer moves the child's rating and the problem's. Difficulty chases the child – not the calendar, not the class average.

3,150

maths problems live in the build, laddered into curriculum steps with per-domain unlocks.

~85%

first-attempt accuracy we tune toward – **a design target**, taken by analogy from the optimal-difficulty literature.⁶

2

themes ship as **data, not code** – forest and sci-fi already. Reskinning is a content job.

We deleted the moment a child feels stupid.

01 New maths is taught before it is asked. The first attempt cannot hurt you.

02 A second miss reveals the answer and explains it. A failure ends in teaching.

03 Getting right what you got wrong is the loudest celebration in the game.

WHERE WE ARE

Not a concept. It runs.

LIVE ENCOUNTER · ENGLISH

SAME BUILD · ÍSLENSKA

Built

3,150 problems · 6 levels · Elo learner model · per-child profiles · English and Icelandic.

Played

One child, near-daily, for months. **n=1, and we say so.** No telemetry yet.

Next

One Icelandic class, playing and giving feedback. [\[pilot status\]](#)

Every screenshot in this deck came out of the running build.

Parents and schools, pulling each other in.

-
- 01 Free at home. A link, not an install. A name and a PIN, no email, no funnel.
 - 02 The child asks for it. The parent asks the school. Demand arrives before the sales call.
 - 03 The school buys it – and sends it home with every parent. One sale, a classroom of new households.
-

The classroom is the cash cow. The kitchen table is the salesman.

THE MODEL

Free while we prove it. Then **both sides pay.**

PARENTS · B2C

- Home subscription, low price, high volume
- Retention data in weeks, not procurement quarters

SCHOOLS · B2B

- Per-pupil annual licence – the cash cow
- Every licence hands us a classroom of parents

TODAY

Free. Prototyping and feedback.

DELIVERY

Web. No COGS, no shipping.

PRICING

[per-pupil / per-month]

Each channel sells the other.

Iceland pays for a team. The Nordics pay for **a company**.

WHAT IT COSTS

2.3m ISK

PER PERSON, PER MONTH

1.75m salary +33% employer cost

Four people +35% contractors →
12.6m/mo

≈ €90k a month, €1.1m a year

WHAT IS OUT THERE

47,162

ICELANDIC PUPILS · 174 SCHOOLS

Ages 5–7 today: ~14,000 (three cohorts)

Pre-school top year adds ~4,700

One buyer per school, not per parent

WHAT BREAKS EVEN

Every school

+ ~5,000 PAYING FAMILIES

School: 2,000 ISK per pupil per year

Parents: 990 ISK a month

A **two-person** team breaks even on Iceland alone

Lever: **headcount** **price per pupil** **parent conversion** **countries** Every figure here is a dial, not a forecast.

We do not need a big market. We need a small country twice.

COMPETITION

The maths leaders are worksheets with sprites.

Prodigy

\$125m raised, tens of millions of learners – an RPG wrapper around a question bank.⁸

SplashLearn

~1,900 activities, pre-K to grade 5. Breadth over depth, and worksheets in the box.⁸

DragonBox

Genuinely good puzzle design, ages 4-14 – but a puzzle set, not a game kids return to.⁸

None of them is a platformer. None speaks Icelandic.

THE TEAM

One builder. Three named gaps.

[your name]

FOUNDER

Shipped the running build
solo: engine, learner
model, content pipeline,
two locales.

Technical co-founder

[STATUS]

Owens sync, scale, apps,
and the telemetry the
research will need.

Artist

[STATUS]

Art direction and the
reskin pipeline. The seat
that makes it wanted.

Teacher + academic

[STATUS]

Speaks the school's
language, and runs the
study that turns claims
into evidence.

Credibility with schools is a hire, not a slide.

THE PLAN

From proof to evidence.

The milestone that matters is a teacher asking for it back.

THE ASK

€350k for 18 months,
to get from a build to evidence.

WHAT IT BUYS · 18 MONTHS

- ▶ One full-time hire at 2.3m ISK loaded, founder deferred
- ▶ Contract art and academic time – not headcount
- ▶ The classroom pilot and the efficacy study

WHAT IT PROVES · THEN WE SCALE

- ▶ Children choose it at home, unprompted
- ▶ Measured maths gain against a control group
- ▶ First paying school – which is what funds the full team

The method is already proven. We are aiming it.
